OBJECTIVE

I am a Master of Science in Engineering Mathematics with a strong foundation in statistics, optimization, mathematical modelling and programming, seeking a quantitative and technically challenging role where I can solve complex problems and create practical value from data. I am particularly interested in opportunities involving data analysis, predictive modelling, machine learning and quantitative decisionmaking, where I can combine rigorous analytical thinking with Python, SQL and statistical methods while continuing to develop my technical expertise.

EDUCATION

M.Sc. in Engineering Mathematics – Chalmers University of Technology 2020 — 2026

The program is similar to Engineering Physics but with an intensified focus on mathematics, statistics, and computational tools, where theory is complemented by practical programming. During my Master's studies, I chose to specialize in statistics and optimization theory while also taking advanced programming courses. As a result, I am a versatile problem solver with strong logical thinking skills and a proven ability to quickly adapt to complex systems.

EXPERIENCE

Master's Thesis: 'Evaluating Machine Learning Models for Cost Prediction in Swedish Domestic Shipping' – Sendify 2025

- Built data pipelines and trained machine learning models using Python, SQL, Pandas, and scikit-learn.
- Learned to visualize large-scale data, using matplotlib, and present key findings to non-technical parts of the team.
- Learned to structure complex problems and manage scope creep through clearly defined goals and continuous dialogue with company leadership and the technical team.
- Translated model performance into concrete, data-driven recommendations regarding Swedish domestic shipping, presented directly to the company's executive management.

Treasurer, Math Mentor, and Board Member – Intize 2023 — 2025

- Managed a heavily reduced annual budget while ensuring operations continued to run effectively, thereby gaining practical experience with grant applications and formal reporting to financial backers.
- As a board member, I contributed to strategic planning and the long-term development of the organization.
- Learned how to present complex problems in a simple and accessible manner.

PROJECTS

'GPU-Accelerated FEM Solver: From Heat Equation to Black-Scholes' - Chalmers 2026

- Learned to use Python and GPU-accelerated libraries such as CuPy and Numba CUDA, alongside standard scientific computing tools like SciPy and NumPy.
- Gained an understanding of how differences in memory and thread management between the CPU and GPU affect execution, and how algorithms must be adapted and restructured to run efficiently on the GPU.
- Learned to operate inside of a HPC environment with resource allocation using Bash-scripts.

'Predicting Molecular Fragmentation Using Graph-to-Graph Models' - AstraZeneca 2024

- Used Python to adapt existing graph-based neural network for our purpose.
- Learned to quickly familiarize myself with a research-heavy field.
- Learned to work in a structured manner within a team environment.

SKILLS

Programming	Python, scikit-learn, SciPy, NumPy, SQL, R, Git
Languages	Swedish, English, Polish
